How do you power lights on a bicycle?

When it comes to powering lights on a bicycle, there are two main types of dynamo that can be used: pedal-powered dynamos and battery-powered dynamos. Both types have their own mechanisms for generating electricity to power the lights.

What is a human powered generator based on a used bicycle?

The intention of this project is to build a straight forward human powered generator from a used bicycle and to use it to power light bulbs, blenders, cell phones, laptops, and other small appliances. This project will help one develop engineering skills while learning about a clean way of generating electricity.

These are problems from the (literally) dim past. Modern lamps feature better electrical regulation, their LEDs last nearly forever, and built-in capacitor power storage keeps the lights on when the bike is stopped. If you aren't ready to buy a new generator, you can still avoid these problems with a ...

From my research, direct mechanical power is the sweet spot for powering things by bicycle. The bicycle blender I made and shared in a previous post is an excellent example of this; the spinning of the bike wheel directly spins the blades of the blender, replacing the need for an electrical motor to do so.
