Abstract. Performance of a novel ultracompact thermal energy storage (TES) heat exchanger, designed as a microchannel finned-tube exchanger is presented. With water as the heating-cooling fluid in the microchannels, a salt hydrate phase change material (PCM), lithium nitrate trihydrate ($\text{LiNO}_3 \cdot 3\text{H}_2\text{O}$), was encased on the fin side. To establish the ...

The new LHS heat exchanger can achieve the functions of heat storage, heat release, and simultaneous heat supply and storage, which can better solve the intensity mismatch of renewable energy. The new device has a broad range of applications due to its independent cold and hot fluid channels.

The correlation for charging time is based on a structure proposed by Raud et al. [27] which was expanded and has good agreement with data sets found in literature [28]. However, the correlation structure is based on the phase change time and thus linked to the stored latent heat instead of the stored total heat [23], [27]. On the other hand, the charging ...

We are able to perform on-site instrumentation of your heat exchanger in order to accurately determine the heat performance of your heat exchanger. Once the data is collected, our thermal specialists will analyze it to determine the exact performance of your exchanger and to identify possible causes of underperformance.

To evaluate and compare the heat storage performance of units with diverse structures, the average heat storage rate \bar{P} [44] is introduced in this paper, and the expression is as follows, (17) $\bar{P} = \frac{Q}{t_m}$ where Q represents the total heat stored in an LHTES unit when the PCM is entirely melted, including sensible heat and latent heat; t_m denotes ...

Recent studies have focused on improving the thermal performance of PCM HXs by optimizing the spacing and geometry of fins to maximize the energy storage capacity of the system [54, 55] one study, PCM HX performance was numerically and experimentally investigated for rectangular-type and fractal-type metal fins

[54]. The HX system incorporated a 50 °C phase ...

With this aspect ratio, a staggered heat exchanger with an energy storage capacity of 1800 kJ was designed, as shown in Fig. 14. The total PCM volume was 0.01 m³ for different structures. During energy storage, the heat transfer fluid (HTF) whose temperature was higher than the melting point of paraffin entered the heat exchanger.
