

DUE to growing concerns about climate change and the imperative carbon neutral transition, increased attention has been paid to renewable energy solutions, among which the hydrogen (H<sub>2</sub>) energy has been acknowledged as a promising clean energy carrier to drive decarbonization. In 2021, global H<sub>2</sub> demand reached 94 million tonnes (Mt), and it is projected ...

In order to limit global warming to 2 °C, countries have adopted carbon capture and storage (CCS) technologies to reduce greenhouse gas emission. However, it is currently facing challenges such as controversial investment costs, unclear policies, and reduction of new energy power generation costs. In particular, some CCS projects are at a standstill. To ...

Based on various sources in scientific literature, published books, discussions with corporations, start-up companies' investors and funding agencies, the six identified and widely recognized carbon neutral or climate technology platforms include electrification, carbon-free and renewable energy, hydrogen or ammonium platforms, carbon capture ...

Our findings reveal the feasibility of carbon neutral energy transition using renewable generation, energy storage, and energy-efficient technologies. Introduction The Paris Agreement's central goal is to limit the increase in global average temperature to well below 2 °C above the preindustrial levels and to pursue efforts to limit it to 1.5 °C. ...

We created multiple blueprints for the United States to reach zero or negative CO<sub>2</sub> emissions from the energy system by 2050 to avoid the most damaging impacts of climate change. By methodically increasing energy efficiency, switching to electric technologies, utilizing clean electricity (especially wind and solar power), and deploying a small amount of carbon ...

In April 2021, the United States set a target to create a "carbon pollution-free power sector by 2035"--an important element in the country's goal of reducing emissions 50 to 52 percent by 2030 and achieving net-zero emissions by 2050. 1 "Fact sheet: President Biden sets 2030 greenhouse gas pollution reduction target aimed at creating good-paying union jobs and ...

Achieving a balance between the amount of GHGs released into the atmosphere and extracted from it is known as net zero emissions [1]. The rise in atmospheric quantities of GHGs, including CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O is the primary cause of global warming [2]. The idea of net zero is essential in the framework of the 2015 international agreement known as the Paris ...

A recent International Panel on Climate Change (IPCC) report recommends that global energy systems strive for carbon neutrality by around 2050 with the aim of limiting the rise in the global average surface

temperature to 1.5°C, accounting for 30% of global anthropogenic CO<sub>2</sub> emissions, represents one of the most significant challenges for ...

The number of countries announcing pledges to achieve net zero emissions over the coming decades continues to grow. But the pledges by governments to date - even if fully achieved - fall well short of what is required to bring global energy-related carbon dioxide emissions to net zero by 2050 and give the world an even chance of limiting the global ...

With the global ambition of moving towards carbon neutrality, this sets to increase significantly with most of the energy sources from renewables. As a result, cost-effective and resource efficient energy conversion and storage will have a great role to play in energy decarbonization. This review focuses on the most recent developments of one of the most ...

The increasing global industrialization and over-exploitation of fossil fuels has induced the release of greenhouse gases, leading to an increase in global temperature and causing environmental issues. There is therefore an urgent necessity to reach net-zero carbon emissions. Only 4.5% of countries have achieved carbon neutrality, and most countries are ...

This focus issue showcases a sample of current research accomplishments at the International Institute for Carbon Neutral Energy Research (I<sup>2</sup>CNER) and reviews some recent developments in the area of materials for carbon-neutral energy technologies. I<sup>2</sup>CNER was inaugurated as the sixth institute of the World Premier International Research Center ...

**2.2 Carbon Neutral Model of Zero-Carbon Industrial Parks.** From a macro perspective, achieving carbon neutrality in parks can be achieved through controlling carbon emissions, increasing carbon absorption and participating in the carbon trading market. ... which introduced a multi-energy storage and supply model with dual SOC characteristics of ...

China's strategies for reaching carbon neutrality may be categorized into energy saving, carbon reduction, and sink augmentation. Firstly, it is worth noting that China is the only global nation with an utterly industrialized system (Xi, 2018). Fossil energy is the primary source of energy consumption, and the excessive use of fossil energy is the primary factor behind the ...

This paper develops a carbon-neutral transition model for China's power generation side. The simulation is applied to the time period of 2020-2060. The final step of the transition process is to build a sustainable carbon-neutral power generation system. ... Here, we express the capacities of energy storage as a percentage of the renewable ...

It will also make it easier to install energy storage for solar power generated locally. Among other impacts, these changes will open solar opportunities in over 8,500 acres of parking lots across the city. ... Among other things, it will require many large buildings to cut their carbon emissions or face significant fines.

As is known to all, an abundant supply of biomass for large-scale bioenergy with carbon capture and storage has the mitigating potential to limit global warming to 1.5 °C (IPCC, 2019). This makes biomass energy a unique and key role in the clean supply of electricity, thus having a broader development prospect in the context of carbon neutrality.

The deployment of carbon neutral energy supply systems and the pathway to that are obtained by minimizing long-term system costs, and infrastructure layout and energy flows amongst regions are pointed out. ... transmission and storage facilities [19]. Another model of hydrogen supply chains in Germany was developed to obtain the optimal ...

Although model parameters may differ from real conditions, China is capable to advance carbon peak, which was already accepted and recognized by the world. ... The analytical framework of carbon neutral contents ... The bio-energy carbon capture and storage (BECCS) technique is a combination of bio-energy and CO<sub>2</sub> capture and storage to achieve ...

In terms of environmental parameters, carbon emissions for manufacturing unit production are 0.98. Carbon emissions for inventory are set at 0.5. The carbon emission per unit of energy consumption is 0.01. Carbon emissions for the carbon capture, utilization, and storage are set at 0.05, 0.01, and 0.01, respectively.

The green energy transition has become a global consensus for mitigating climate change. Currently, 135 countries have pledged to be carbon neutral by the mid-century, and 125 have set goals to achieve net zero emissions before 2070 [1]. As the largest carbon emitter in the world, China made a solemn commitment at the 75th UN General Assembly to ...
