What is a trip curve in a circuit breaker?

A trip curve also known as a current time graph is a graphical representation of the response of a circuit breaker. It shows the current relationship with the tripping time of a protection device. Why We Need Different Tripping Curves? Circuit breakers are used for tripping the power supply as quickly as possible in case of overcurrent.

What is the tripping point of a circuit breaker?

The first curve in the graph shows the response of a thermal trip unit. While the magnetic region shows the response of the solenoid to fault current such as a short circuit current. As seen from the graph, a circuit breaker does not have a fixed tripping time and we cannot predict an exact tripping point.

What is a time-current curve in a circuit breaker?

This is illustrated by the time-current curve below. The bottom part of the time-current curve shows the performance of the instantaneous trip component (short circuit) of the circuit breaker. The maximum clearing time (time it takes for breakers to completely open) decreases as current increases.

What is a circuit breaker curve?

Curves are developed using predefined specifications such as operation at an ambient temperature of 40°C, so keep in mind that the actual operating conditions of the circuit breaker can cause variations in its performance. Most curves have an information box that will define which circuit breaker the curve applies to.

How long does a circuit breaker trip?

For example, the breaker will trip between 25 seconds and 175 seconds at 600 amps with a 40°C ambient temperature, which is 3 times the trip unit rating. This is illustrated by the time-current curve below. The bottom part of the time-current curve shows the performance of the instantaneous trip component (short circuit) of the circuit breaker.

What is a limiting curve in a circuit breaker?

Limitation curves are associated with the voltage applied to the circuit breaker; in general, for the same available short circuit current, if the voltage applied is higher, the limiting capacity of the device shall decrease, letting through a higher peak current and I^2t . These curves are made available

the circuit breaker interrupting rating, the circuit breaker is no longer a protective device. In the example graph below, the interrupting rating at 480 volts is 30,000 amps. The interrupting ratings on circuit breakers vary according to breaker type and voltage level. The marked interrupting on a circuit breaker is a three-pole rating

Air Circuit Breaker (ACB) Air Circuit Breaker (ACB) is an electrical gadget used to give Overcurrent and Short-circuit protection for electric circuits over of 800 Amps to 10K Amps. These are typically utilized in low voltage applications beneath 450V. We can find these frameworks in Distribution Boards (underneath 450V).

Long-Time Function. In electronic circuit breakers, the long-time function (L) simulates the effect of a thermal bi-metal element. The nominal pickup point where an electronic trip unit senses an overload is roughly around 10% of the selected ampere rating. Once picked up, the circuit breaker will trip after the time specified by the long-time delay adjustment has ...
