Among these methods, mechanical energy storage comprises pumped storage, compressed air energy storage (CAES), and flywheel energy storage, offering distinct advantages. Compared with others, CAES systems have several benefits: When contrasted with pumped storage, the CAES system offers greater scalability, locational flexibility and capacity ...

Based on CAES (compressed air energy storage) and PM (pneumatic motor), a novel tri-generation system (heat energy, mechanical energy and cooling power) is proposed in this paper. Both the cheap electricity generated at night and the excess power from undelivered renewable energy due to instability, can be stored as compressed air and hot water ...

By analyzing the thermodynamic process of energy storage and power generation process of ACAES system, the mathematical model of the compressed air energy storage system is established. Then, ACAES system is connected to power grid through permanent magnet synchronous motor/generator (PMSM/G).

In the designed system, the energy storage capacity of the designed CAES system is defined about 2 kW. Liquid piston diameter (D), length and dead length (L, L dead) is determined, respectively, 0.2, 1.1 and 0.05 m. The air tank capacity (V tank) is 0.5 m³. The equations used in system design and modeling are given below.
