Can seasonal pumped hydropower storage provide long-term energy storage?

Seasonal pumped hydropower storage (SPHS) can provide long-term energy storage at a relatively low-cost and co-benefits in the form of freshwater storage capacity. We present the first estimate of the global assessment of SPHS potential, using a novel plant-siting methodology based on high-resolution topographical and hydrological data.

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6]. Figure 1 shows the current global ...

Even though PSH is the most cost-effective form of grid energy storage currently available, new pumped storage development faces several challenges, such as its licensing and the valuation of the services it can provide. Accordingly, there has been very little new pumped storage development in the United States over the past 30 years.

Today, compressed air energy storage is considered mature and reliable, offering similarly low capital cost between 2-50 \$/kWh, and electro-chemical batteries offer high energy density with higher costs, and experience drastic growth while the impact of hydrogen-based storage in the energy transition is largely expected to be substantial [10].

Congestion in power flow, voltage fluctuation occurs if electricity production and consumption are not balanced. Application of some electrical energy storage (EES) devices can control this problem.
