How does a pumped storage hydropower project work?

Pumped storage hydropower projects use electricity to store potential energy by moving water between an upper and lower reservoir. Using electricity from the grid to pump water from a lower elevation, PSH creates potential energy in the form of water stored at an upper elevation, which is why it is often referred to as a "water battery".

How do pumped storage projects work?

The developers of the pumped storage project will study their site conditions, markets they will serve, economics and make equipment configurations selections from the aforementioned technologies. They will also make selections on the number of units and MW size.

How many GW of pump storage projects are in the FERC process?

In addition, FERC reports that 44 GW of pump storage development are in the Preliminary Permit process. The developers of these projects are prepared to advance their PSH projects, especially those that have received their license.

Can a pumped storage facility be regulated?

The current U.S. fleet of operating (single-speed) pumped storage plants does not provide regulation in the pump mode because the pumping power is "fixed" - a project must pump in "blocks" of power - though a single pumped storage facility may consist of multiple units and smaller blocks of power.
