Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

The added effect of these drawbacks makes the modernization of battery recycling not attractive to the market. Thus, the destination of a high proportion of new energy storage devices are landfills, where their components leach out into soil and water, and if the litter is incinerated, the atmosphere [37].
