Legislative and voluntary political actions in Europe call for a reduction of CO₂ emissions of a manufacturer's vehicle fleet, rather than for iconic niche products. Micro-hybrids offer, at lowest absolute fuel or CO₂ savings, still the best cost/benefit ratio among all hybrid concepts (Fig. 3). If applied in large volumes, they may offer the best leverage for fleet CO₂ ...

Summary Electric vehicles (EVs) have a limited driving range compared to conventional vehicles. ... 2.2.5 Battery model. There are two main energy storage systems in the BMW i3: the high voltage Lithium-ion battery pack used to propel the vehicle and the low voltage (12 V) Lead Acid battery that powers the auxiliary devices. ... driving control ...

1. Introduction. It is well acknowledged that rising carbon emissions and limited petroleum availability pose increasing risks to the planet. With almost 28% of global energy use and greenhouse gas emissions coming from the transportation sector [], the sector has the biggest overall environmental impact. Over 70% of the emissions in this sector come from the ...

There are various factors for selecting the appropriate energy storage devices such as energy density (W·h/kg), power density (W/kg), cycle efficiency (%), self-charge and discharge characteristics, and life cycles (Abumeteir and Vural, 2016). The operating range of various energy storage devices is shown in Fig. 8 (Zhang et al., 2020). It ...

A hybrid energy storage system (HESS), which consists of a battery and a supercapacitor, presents good performances on both the power density and the energy density when applying to electric vehicles. In this research, an HESS is designed targeting at a commercialized EV model and a driving condition-adaptive rule-based energy management ...

response for more than a decade. They are now also consolidating around mobile energy storage (i.e., electric vehicles), stationary energy storage, microgrids, and other parts of the grid. In the solar market, consumers are becoming "prosumers"--both producing and consuming electricity, facilitated by the fall in the cost of solar panels.

Oldenbroek et al. [11] considered the use of hydrogen in the tanks of fuel-cell driven vehicles as potential energy storage medium in the model of a smart city, while Robledo et al. [12] presented the results of a

demonstration project that included building-integrated photovoltaic solar panels, and a hydrogen fuel-cell electric vehicle for ...

In recent years, with the support of national policies, the ownership of the electric vehicle (EV) has increased significantly. However, due to the immaturity of charging facility planning and the access of distributed renewable energy sources and storage equipment, the difficulty of electric vehicle charging station (EVCSs) site planning is exacerbated.

With the rise of electric vehicle (EV), EV connected to distribution grid is easy to cause problems such as high peak load fluctuation, increased grid loss and line overload [1], EV provides IES with a flexible power load and distributed energy storage resource. Therefore, it has become an inevitable trend to include EV in the consideration of IES.

In ESS, different types of energy storage devices (ESD) that is, battery, super capacitor (SC), or fuel cell are used in EV application. The battery is stored in the energy in electrochemical and delivers electric energy. Where SC has stored energy in the form of static electric charge and mainly hydrogen (H_2) is used in the fuel cell ...

Thermal Energy Storage (TES) systems are pivotal in advancing net-zero energy transitions, particularly in the energy sector, which is a major contributor to climate change due to carbon emissions. In electrical vehicles (EVs), TES systems enhance battery performance and regulate cabin temperatures, thus improving energy efficiency and extending vehicle ...

With the rapid development of battery material technology, fast charging technology and motor control technology, battery life has grown significantly, while the cost of batteries has decreased significantly, greatly promoting the application of pure electric vehicles [1]. Related studies have shown that in urban conditions, the energy consumed during braking ...

The paper proposed three energy storage devices, Battery, SC and PV, combined with the electric vehicle system, i.e. PV powered battery-SC operated electric vehicle operation. It is clear from the literature that the researchers mostly considered the combinations such as battery-SC, Battery- PV as energy storage devices and battery-SC-PV ...

Electric vehicles (EVs) of the modern era are almost on the verge of tipping scale against internal combustion engines (ICE). ICE vehicles are favorable since petrol has a much higher energy density and requires less space for storage. However, the ICE emits carbon dioxide which pollutes the environment and causes global warming. Hence, alternate engine ...

This special section aims to present current state-of-the-art research, big data and AI technology addressing the energy storage and management system within the context of many electrified vehicle applications, the energy storage system will be comprised of many hundreds of individual cells, safety devices, control electronics, and a thermal management subsystem.
