The core components include water pumps, compressors, heat exchangers, etc. The internal battery pack liquid cooling system includes liquid cooling plates, pipelines and other components.

A combined cooling, heating, and power (CCHP) system can improve primary energy usage through energy cascade utilization, and it has the advantage of reducing CO₂ and particulate matter^{2.5} emissions, which is an important trend of future energy technologies [1]. However, multi-energy flow coupling restricts the development and application of CCHP.

In the design process, operational control of cold storage unit in cooling system is significant to the high efficiency. Currently, LIB thermal management systems can be divided into three main types: air-cooled, liquid-cooled, and phase change material cooling systems [14, 15]. Air-cooled (AC) type means that air is used as the cooling medium to take away the heat in the system through airflow to achieve the cooling effect.

This is because the round-trip efficiency (i.e., the ratio of the energy recovered by the system during the discharge stage to the total energy input) of a LAES system can be substantially improved when cold energy released by liquefied air during the discharge stage is stored and reused to reduce the work required for liquefaction [75], [76].
