

Why is distributed energy storage important?

This can lead to significant line over-voltage and power flow reversal issues when numerous distributed energy resources (DERs) are connected to the distribution network. Incorporation of distributed energy storage can mitigate the instability and economic uncertainty caused by DERs in the distribution network.

How does a distribution network use energy storage devices?

Case4: The distribution network invests in the energy storage device, which is configured in the DER node to assist in improving the level of renewable energy consumption. The energy storage device can only obtain power from the DER and supply power to the distribution network but cannot purchase power from it.

Where is energy storage device installed in a distributed energy resource?

In this situation, the energy storage device is installed by the DNO at the DER node, which is physically linked to the distributed energy resource. The energy storage device can only receive power from DER and subsequently provide it to DNO for their use.

What are the constraints of distributed energy storage?

Furthermore, the power capacity of distributed energy storage must meet the constraint of battery charging rate (C-rate). This means that the ratio of battery power to capacity must be subject to the C-rate constraint. These constraints are given in Eq. (6):
$$P_{e,s,i} \leq C_{rate} E_{e,s,i} U_{e,s,i} \in \{0,1\}$$

Is energy storage a new business opportunity?

With the rise of intermittent renewables, energy storage is needed to maintain balance between demand and supply. With a changing role for storage in the energy system, new business opportunities for energy storage will arise and players are preparing to seize these new business opportunities.

Are energy storage business models fully developed?

Even though the business models are not yet fully developed, the cases indicate some initial trends for energy storage technology. Energy storage is becoming an independent asset class in the energy system; it is neither part of transmission and distribution, nor generation. We see four key lessons emerging from the cases.
