

Li<sub>3</sub>N interlayer enables stable long-term cycling for sulfide-based all-solid-state Li metal batteries. ... Ultra-thin free-standing sulfide solid electrolyte film for cell-level high energy density all-solid-state lithium batteries. *Energy Storage Mater.*, 38 (2021), pp. 249-254. [View PDF](#) [View article](#) [View in Scopus](#) [Google Scholar](#)

In recent years, researches on LDHs have gained deeper theoretical support based on the definition of supramolecular chemistry and intercalation assembly [16], [17], [18]. LDHs have strong covalent bonds within the host laminates, while the interlayer guests are bound to the laminates by electrostatic interactions, hydrogen bonding, van der Waals forces, ...

The development of advanced energy storage systems is of crucial importance to meet the ever-growing demands of electric vehicles, portable devices, and renewable energy harvest. ... the Li<sup>+</sup>-channel interlayer delivered very lower polysulfide permeability and better Li ion storage performance than the cell without the interlayer. [Download ...](#)

Metal oxide nanoparticles deposited on the surface of GO sheets have been used as nanocatalysts to promote the etching reaction of graphitic C. Kim and co-authors [73] reported a scalable fabrication of microscaled HG with a high density of nanoholes via the catalytic C gasification (Figure 3 B). First, SnO<sub>2</sub> nanoparticles were uniformly grown on the ...

Successful selective etching of A from the layered MAX precursors without dissociation of nitride MXene solids usually results in stacked accordion-like multilayer MXenes, as mentioned above. [32, 47] Because of the strong interlayer coupling of MXene layers and higher exfoliation energy than the Ti<sub>3</sub>C<sub>2</sub>T<sub>x</sub> carbide MXene, [35] the as-etched ...

Thus, to guarantee exceptional energy storage performance, interlayer channels must be precisely defined in accordance with practical requirements [91]. To maximize the benefits of precise interlayer spacing control, two unique strategies for optimizing interlayer spacing during fabrication have been proposed: (i) controlling physical ...

The lead acid battery has been a dominant device in large-scale energy storage systems since its invention in 1859. It has been the most successful commercialized aqueous electrochemical energy storage system ever since. In addition, this type of battery has witnessed the emergence and development of modern electricity-powered society. Nevertheless, lead acid batteries ...

A two-level power management strategy in a DC-coupled hybrid microgrid powered by fuel cell and energy storage systems with model predictive controlled interface converter. Ali Abdollahi Arjanaki, Arash Dehestani

Kolagar, Mohammad Reza Alizadeh Pahlavani ... select article Vanadium disulfide-coated carbon nanotube film as an interlayer for high ...

**Layered Metal Oxides** Layered metal oxides are essential electrode materials for electrochemical energy storage devices such as LIBs, SIBs, supercapacitors, etc. Layered structures, with large interlayer distances that facilitate diffusion and storage of cations and electrons, consist of a variety of metal oxides, such as manganese-based oxides ...

In typical chloride-containing electrolytes, storage of  $\text{MgCl}^+$  is dominant in organic cathodes. The negative impact of the  $\text{MgCl}$ -storage chemistry on the specific energy was elucidated through cell tests with controlled amounts of electrolyte. With the right combination of organic cathodes and chloride-free electrolytes, storage of  $\text{Mg}^{2+}$  in organic electrodes can be ...

In recent years, tungsten disulfide ( $\text{WS}_2$ ) and tungsten selenide ( $\text{WSe}_2$ ) have emerged as favorable electrode materials because of their high theoretical capacity, large interlayer spacing, and high chemical activity; nevertheless, they have relatively low electronic conductivity and undergo large volume expansion during cycling, which greatly hinder them in ...

**1 Introduction.** Energy conversion and storage have become global concerns with the growing energy demand. 1 Layer structured materials, with crystal structures similar to that of graphite (i.e., weak van der Waals interactions between adjacent layers, strong covalent bonding within the intralayer) have attracted increasing attention for many energy-related ...

The advancement of grid-level energy storage systems is essential for the continued integration of renewable energy sources. [1, 2] Lithium-ion ...  $\text{MnO}_2$  cells with different anodes also show that the electrosynthetic MOF interlayer grants the cell the smallest charge transfer resistance, as well as excellent cyclic stability (Figure S8a ...

The high electric field energy storage performance was characterized via displacement-electric field (DE) loops. The area inside the loops represented energy dissipation. At the same electric field, PI films with the coating exhibited much narrower DE loops relative to the uncoated films ( Figures 4 A and 4B), especially at  $150^\circ\text{C}$ , indicating ...

A novel lithiophilic interlayer of N-doped graphene nanosheet wrapped Fe<sub>3</sub>N functionalized separator ( $\text{Fe}_3\text{N}@ \text{NG}/\text{PP}$ ) was rationally designed and applied for Li metal batteries. The stronger interaction between Li atoms and  $\text{Fe}_3\text{N}@ \text{NG}$  can adjust Li ion and promote ion migration kinetics, which can result in stable Li plating/stripping, further mitigating ...

Lithium-sulfur cells are increasingly recognized as promising next-generation energy storage devices, owing to their high theoretical specific capacity of 1675 mAh g<sup>-1</sup> and exceptional energy density (2600 Wh kg<sup>-1</sup>) suitable for effectively powering electric vehicles. Shuttling of polysulfides during charge-discharge cycles,

volume expansion of sulfur cathode ...

MXene has garnered widespread recognition in the scientific community due to its remarkable properties, including excellent thermal stability, high conductivity, good hydrophilicity and dispersibility, easy processability, tunable surface properties, and admirable flexibility. MXenes have been categorized into different families based on the number of M and ...
