What is a hot water storage tank?

Hot water storage tanks can be sized for nearly any application. As with chilled water storage, water can be heated and stored during periods of low thermal demand and then used during periods of high demand, ensuring that all thermal energy from the CHP system is efficiently utilized.

What are the different types of thermal energy storage?

The different kinds of thermal energy storage can be divided into three separate categories: sensible heat, latent heat, and thermo-chemical heat storage. Each of these has different advantages and disadvantages that determine their applications. Sensible heat storage (SHS) is the most straightforward method.

Which tank storage systems are connected to district heating networks?

The two largest seasonal tank storage connected to district heating networks are the Friedrichshafen storage and the Kungälv storage. These T-TESs are respectively 12,000 m³ and 10,000 m³.
