This energy storage system involves using electricity to compress air and store it in underground caverns. When electricity is needed, the compressed air is released and expands, passing through a turbine to generate electricity. There are various types of this technology including adiabatic systems and diabatic systems.

Compressed air energy storage (CAES) technology has received widespread attention due to its advantages of large scale, low cost and less pollution. However, only mechanical and thermal dynamics are considered in the current dynamic models of the CAES system. The modeling approaches are relatively homogeneous.

The transition from a carbon-rich energy system to a system dominated by renewable energy sources is a prerequisite for reducing CO<sub>2</sub> emissions [1] and stabilising the world's climate [2]. However, power generation from renewable sources like wind or solar power is characterised by strong fluctuations [3]. To stabilise the power grid in times of high demand but ...

Compared to compressed air energy storage system, compressed carbon dioxide energy storage system has 9.55 % higher round-trip efficiency, 16.55 % higher cost, and 6 % longer payback period. At other thermal storage temperatures, similar phenomenons can be observed for these two systems. After comprehensively considering the obtained ...

Le CAES (de l'anglais Compressed Air Energy Storage) est un mode de stockage d'énergie par air comprimé, c'est-à-dire d'énergie mécanique potentielle, qui se greffe sur des turbines à gaz. Comment ça marche ? Dans une turbine à gaz classique, de l'air ambiant est capté et comprimé dans un compresseur à très haute pression (100 à 300 bar).

With increasing global energy demand and increasing energy production from renewable resources, energy storage has been considered crucial in conducting energy management and ensuring the stability and reliability of the power network. By comparing different possible technologies for energy storage, Compressed Air Energy Storage (CAES) is ...
