The principle behind Flyback converters is based on the storage of energy in the inductor during the charging, or the 'on period,' t_{on} , and the discharge of the energy to the load during the 'off period,' t_{off} . There are four basic types that are the most common, energy storage, inductor type converter circuits. 1. Step down, or buck converter. 2.

The interleaved flyback converters are widely used for the application of the renewable energy sources, electric vehicles, LED drivers et al.
