

Is superconducting energy storage dangerous

Superconducting magnetic energy storage (SMES) is the only energy storage technology that stores electric current. This flowing current generates a magnetic field, which is the means of energy storage. The current continues to loop continuously until it is needed and discharged.

This CTW description focuses on Superconducting Magnetic Energy Storage (SMES). This technology is based on three concepts that do not apply to other energy storage technologies (EPRI, 2002). First, some materials carry current with no resistive losses. Second, electric currents produce magnetic fields.
