

Which energy storage option is most cost-effective?

The application analysis reveals that battery energy storage is the most cost-effective choice for durations of <2 h, while thermal energy storage is competitive for durations of 2.3-8 h. Pumped hydro storage and compressed-air energy storage emerges as the superior options for durations exceeding 8 h.

Which energy storage technology has the best economic performance?

When the storage duration is 1 day, thermal energy storage exhibits the best economic performance among all energy storage technologies, with a cost of <0.4 CNY/kWh. Even with increased storage durations, the economic performance of TES and CAES remains considerable. Fig. 8. Economic performance under the day-level energy storage scenario.

Are energy storage technologies economically viable?

Through a comparative analysis of different energy storage technologies in various time scale scenarios, we identify diverse economically viable options. Sensitivity analysis reveals the possible impact on economic performance under conditions of near-future technological progress.

What are the benefits of energy storage?

There are four major benefits to energy storage. First, it can be used to smooth the flow of power, which can increase or decrease in unpredictable ways. Second, storage can be integrated into electricity systems so that if a main source of power fails, it provides a backup service, improving reliability.

What are the economic benefits of storage capacity?

In the context of residential behind-the-meter storage, the economic benefit of storage capacity is that it yields a price premium, given as the difference between the retail electricity price and the overage tariff that is obtained for surplus energy generated by the solar PV system but not self-consumed.

How can energy storage technology improve economic performance?

To achieve superior economic performance in monthly or seasonal energy storage scenarios, energy storage technology must overcome its current high application cost. While the technology has shown promise, it requires significant technological breakthroughs or innovative application modes to become economically viable in the near future.
