We estimate that by 2040, LDES deployment could result in the avoidance of 1.5 to 2.3 gigatons of CO<sub>2</sub> equivalent per year, or around 10 to 15 percent of today's power sector emissions. In the United States alone, LDES could reduce the overall cost of achieving a fully decarbonized power system by around \$35 billion annually by 2040.

LIBs are the mainstream energy storage system for powering electronic devices and hybrid vehicles, benefitted from their high energy densities, high coulombic efficiencies, and slow self-discharge properties. [138-141] A LIB typically consists of four components: an anode, an electrolyte, a separator, and a cathode.

The Tavis-Cummings (TC) model, which serves as a natural physical realization of a quantum battery, comprises  $N_b$  atoms as battery cells that collectively interact with a shared photon field, functioning as the charger, initially containing  $n_0$  photons. In this paper, we introduce the invariant subspace method to effectively represent the quantum ...

Thermal energy storage is a family of technologies in which a fluid, such as water or molten salt, or other material is used to store heat. This thermal storage material is then stored in an insulated tank until the energy is needed. The energy may be used directly for heating and cooling, or it can be used to generate electricity. ...
