

Gravitricity, a start-up based in Scotland, is developing a 4 to 8 megawatt mechanical energy storage project in a disused mine shaft. Its technology operates like an elevator, using excess electricity from renewables to elevate a solid, densely packed material. The denser the material, the greater the energy storage capacity.

Developing novel scalable manufacturing for energy storage devices, addressing the challenges of integrating multiple energy sources into our electricity grid, and modelling and predicting wildfires are some of the ways of our research is helping. Advanced materials Emerging applications require new approaches to sensors and structures.
