

Could a 'sand battery' solve a problem for green energy?

Finnish researchers have installed the world's first fully working "sand battery" which can store green power for months at a time. The developers say this could solve the problem of year-round supply, a major issue for green energy. Using low-grade sand, the device is charged up with heat made from cheap electricity from solar or wind.

How long can a battery store energy?

Handling the fluctuating power production of renewables will require cheap storage for hours or even days at a time. New types of iron-based batteries might be up to the task. Oregon-based ESS, whose batteries can store energy for between four and 12 hours, launched its first grid-scale projects in 2021.

Could carbon black form a low-cost energy storage system?

Two of humanity's most ubiquitous historical materials, cement and carbon black (which resembles very fine charcoal), may form the basis for a novel, low-cost energy storage system, according to a new study.

From the paper's Abstract: Multilayer stacked nanosheet capacitors exhibit ultrahigh energy densities ($174\text{--}272\text{ J cm}^{-3}$), high efficiencies ($>90\%$), excellent reliability ($>10^7$ cycles), and temperature stability ($-50\text{--}300\text{ }^{\circ}\text{C}$); the maximum energy density is much higher than those of conventional dielectric materials and even comparable to those of lithium-ion batteries.
