In the coming decades, renewable energy sources such as solar and wind will increasingly dominate the conventional power grid. Because those sources only generate electricity when it's sunny or windy, ensuring a reliable grid--one that can deliver power 24/7--requires some means of storing electricity when supplies are abundant and delivering it later when they're not.

To meet the growing demand in energy, great efforts have been devoted to improving the performances of energy-storages. Graphene, a remarkable two-dimensional (2D) material, holds immense potential for improving energy-storage performance owing to its exceptional properties, such as a large-specific surface area, remarkable thermal conductivity, ...

The dispatchability and efficiency of modern concentrating solar tower plants relies on the use of stable high temperature storage and heat transfer media [1], [2], [3].
