This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.

Therefore, we assume γ -Ni(OH)₂ can potentially be reused for energy storage devices, especially, the cathode material of NiMH battery due to its phase purity. As illustrated in Figures 3a and b, Ni particles produced from the cathode material of spent NiMH batteries were densely agglomerated. In other words, Ni microparticles consist of ...
