Where are oxygen and liquid nitrogen stored in a combustor?

The produced oxygen and liquid nitrogen are stored in a pressurized vessel and a cryogenic tank, respectively, for generating power via the high pressure turbine (HT) and low pressure turbine (LT), and assisting combustion in the combustor (B) at peak hours. The produced liquid nitrogen also serves as energy storage medium. Figure 10.5.

Can liquid nitrogen be used as a power source?

Both have been shown to enhance power output and efficiency greatly [186 - 188]. Additionally, part of cold energy from liquid nitrogen can be recovered and reused to separate and condense carbon dioxide at the turbine exhaust, realizing carbon capture without additional energy input.

How to recover cryogenic energy stored in liquid air/nitrogen?

To recover the cryogenic energy stored in the liquid air/nitrogen more effectively, Ahmad et al. [102,103] investigated various expansion cycles for electricity and cooling supply to commercial buildings. As a result, a cascade Rankine cycle was suggested, and the recovery efficiency can be higher than 50 %.

What is a cryogenic energy storage system?

LAES belongs to the technological category of cryogenic energy storage. The principle of the technology is illustrated schematically in Fig. 10.1. A typical LAES system operates in three steps. Step 1 is the charging process whereby excess (off-peak and cheap) electrical energy is used to clean, compress, and liquefy air.

Liquid nitrogen storage comes with several safety risks. A first risk is pressure build-up in the tank or container and the subsequent danger of explosion. If the cryogenic liquid heats up due to poor insulation, it becomes gaseous. One liter of liquid nitrogen increases about 694 times in volume when it becomes gaseous at room temperature and atmospheric pressure.

Liquid Air Energy Storage (LAES) applies electricity to cool air until it liquefies, then stores the liquid air in a tank. The liquid air is then returned to a gaseous state (either by exposure to ambient air or by using waste heat from an industrial process), and the gas is used to turn a turbine and generate electricity.
