

Abstract A unique substance or material that releases or absorbs enough energy during a phase shift is known as a phase change material (PCM). Usually, one of the first two fundamental states of matter--solid or liquid--will change into the other. Phase change materials for thermal energy storage (TES) have excellent capability for providing thermal ...

Latent heat thermal energy storage (LHS) involves heating a material until it experiences a phase change, which can be from solid to liquid or from liquid to gas; when the material reaches its phase change temperature it absorbs a large amount of heat in order to carry out the transformation, known as the latent heat of fusion or vaporization depending on the ...

Thermal energy storage (TES) by using phase change materials (PCM) is an emerging field of study.
