Grid level energy storage is the term used to describe storage technologies that are used to store energy at the grid level, or at the point where the electricity is delivered to consumers. This can include batteries, capacitors, and flywheels located near power plants and substations, as well as large-scale storage systems.

The share of private-led energy investment, in terms of ownership, has increased since 2015. There has been a growing role for renewables, where private entities own nearly three-quarters of investments; energy efficiency, which is dominated by private spending; and private-led spending in grids and battery storage.
