Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C .

It should be noted that the goal of this article is to give detailed insight into the physical principles of solar energy storage, rather than the description of technologies. The technical details of energy storage can be found in the excellent review articles elsewhere (see, for example, References. 17-20, 26-31).

The heat from solar energy can be stored by sensible energy storage materials (i.e., thermal oil) [87] and thermochemical energy storage materials (i.e., $\text{CO}_3\text{O}_4/\text{CoO}$) [88] for heating the inlet air of turbines during the discharging cycle of LAES, while the heat from solar energy was directly utilized for heating air in the work of [89].
