Marine ESS technologies can be categorized into higher energy and power technologies. Higher energy devices such as batteries, fuel cells, pumped hydro, and CAES can supply energy for a longer duration but their power is low.

How can marine energy technologies be cost competitive?

Researchers are working to help marine energy technologies become cost competitive with other resources. With support from WPTO, Ocean Renewable Power Company developed marine energy hydrofoil (or blade) designs that use new materials to reduce costs and increase energy capture by up to 24%.

Why do we need data on marine energy resources?

That's why a team created the most comprehensive, high-resolution data on marine energy resources across the United States. Another project team created a tool for marine energy developers to estimate how much energy their devices could produce at different ocean and river sites.

Is energy storage feasible for oceangoing ships?

Energy storage for oceangoing ships is very challenging with current technology and seems not feasible commercially in near future due to long and steady voyages and high-power requirements. However, hybrid power generation and propulsion are feasible for certain operational modes.
