Can community energy storage improve social welfare?

As a price maker, the community energy storage can not only earn profits through energy arbitrage but also smooth price trajectories and further influence social welfare. We formulate the problem as a finite-horizon Markov decision process that aims to maximize the energy arbitrage and social welfare of the prosumer-based community.

How does energy storage affect consumer welfare?

With the growing scale of energy storage, the welfare benefits become significant, which may stimulate different ownership, such as consumers, producers and prosumers, to focus on their own welfare, thus further influencing storage use. In particular, consumers are likely to increase consumer surplus, so they tend to overuse storage.

Can strategic storage yield social welfare losses?

By definition, dC, C cannot result in social welfare losses compared to not having storage, since $dC, C = 0$ is feasible and dC, C is welfare-maximizing. To show that strategic storage cannot yield social welfare losses, note that $dS, C \geq 0$ if and only if: $p_2^0 - p_1^0 = W \geq 0 \geq 0$.

Does welfare maximizing storage earn more benefits than profit-maximizing storage?

Case studies indicate that welfare-maximizing storage earns more benefits than profit-maximizing storage. The proposed threshold-based algorithm can guarantee optimality and largely decrease the computational complexity of standard stochastic dynamic programming.

Does energy storage allow for deep decarbonization of electricity production?

Our study extends the existing literature by evaluating the role of energy storage in allowing for deep decarbonization of electricity production through the use of weather-dependent renewable resources (i.e., wind and solar).

What is community energy storage?

Background and motivation Community energy storage is one of the advanced smart grid technologies in recent years, which provides lots of benefits for the electric power system in reliability, quality, economy and control.

The current legislation for animal welfare often defines only minimum requirements and does not yet prevent animal welfare-related problems from being widespread in all production stages. Problems are regularly experienced with cattle, pigs, and poultry, and examples range from lameness in dairy cows to tail biting in fattening pigs and feather ...

1 Introduction. Whilst wind power uncertainty impacts complicate market-based power systems operation, this clean source of energy with almost zero operational cost is going to supply 15% of the whole demand by 2025 [].So, considering the increasing wind power penetration rate, investigation of a practical control strategy is required to mitigate the negative ...

Cogeneration of different renewable resources and energy storage systems. The zero-energy building was powered by renewable energy with an energy storage system based on hydrogen storage. The seasonal operation is solved by the cogeneration of water-solar systems. This results in reduced CO₂ emissions and reduces cost by 50%. Billardo et al. [23]

Regulatory boards are promoting closed distribution systems (CDSs), which are different from traditional public-access networks, that can be owned and managed by energy communities (ECs). The inclusion of local renewable energy potential and an adequate schedule of storage devices in a CDS allow cooperation among the EC's members in order to reduce ...
