And the last piece is to add in the thermal energy storage tank tied into the primary chilled water loop. The system can run using just the chillers, or the chiller could be run at night to charge the storage tank when electrical rates are cheaper. The three way valve will close forcing the chilled water to go through the tank.

The two-tanks TES system is the most widespread storage system in CSP commercial applications due to its good thermal properties and reasonable cost [6]. Nowadays, molten salts provide a thermal energy storage solution for the two most mature technologies available on the market (e.g., parabolic trough and tower) and is used as direct and indirect ...
