

The role of the oil pipeline energy storage tank

The development of economy is inseparable from energy consumption [1]. As the main driving force, coal set off the Industrial Revolution in the 19th century, and crude oil took the role in the 20th century [2]. Until now, fossil energy including coal, gas, and oil is still the main body of the global energy structure [3, 4]. Particularly, the consumption of oil and natural gas ...

After oil and water separation, the brine is stored in a tank and transported to the brine plant through the delivery pipeline. The oil then enters the tank storage and enters the oil-blanket pump to participate in the next round of the blanket system where it is recycled.

Transport and storage infrastructure for CO₂ is the backbone of the carbon management industry. Planned capacities for CO₂ transport and storage surged dramatically in the past year, with around 260 Mt CO₂ of new annual storage capacity announced since February 2023, and similar capacities for connecting infrastructure.
