A non-unity power factor means a load is consuming both active and reactive power. Active power (also known as real or true power) is the "useful" component of the AC power and is what contributes to the work done in a system (e.g. rotation of a motor shaft or the glowing of a lightbulb). ... Residential customers do not consume enough ...

The implementation of a unity power factor (UPF) three-phase rectifier has the potential to enhance the power factor (PF). However, the PF and total harmonic distortion (THD) experience degradation in low-output regions due to the utilization of a "critical input inductor" under rated load conditions. In this study, an analysis of the operation principle of a UPF three ...
