Flywheel Energy Storage Systems (FESS) work by storing energy in the form of kinetic energy within a rotating mass, known as a flywheel. Here's the working principle explained in simple way, Energy Storage: The system features a flywheel made from a carbon fiber composite, which is both durable and capable of storing a lot of energy.

In a typical FESS, as seen, the components are the input and output terminals; the power electronic circuits; the electric machine (the motor/generator pack); the bearing system; the speed control tool; the vacuum pump; the cooling system; a burst protective compartment; and the disk or flywheel.
