Conventionally, an energy storage system and two Voltage Source Converters (VSCs) are required to combine the operation of Distribution Static Compensator (DSTATCOM) and Uninterruptible Power Supply (UPS). The DSTATCOM's VSC can compensate for the source voltage sag and swell. However, it cannot compensate for the voltage interruption.

Thus, the classic PWM rectifier is essentially a two-level voltage source converter (2L-VSC). This equivalence extends to multilevel topologies such as neutral point clamped (NPC), active neutral point clamped (ANPC), ... Farhadi, M.; Mohammed, O.
