This study presents an integrated analysis combining numerical simulations, experimental investigations, and machine learning models to simulate the performance of metal hydride systems for hydrogen storage under various conditions by using a LaNi<sub>5</sub> metal hydride cylindrical tank of 500 NL capacity, with a focus on PCM thermal enhancements and surface water ...

The figure illustrates that as the air pressure in the storage device escalates from 2 MPa to 7 MPa, the energy storage power adjustment range shifts from 89.70 kW - 186.73 kW to 128.96 kW - 236.99 kW. The upper and lower limits of the energy storage power adjustment range have increased by 43.77 % and 26.92 %, respectively.

Experimental designs for a solar domestic hot water storage system were built in efforts to maximize thermal stratification within the tank. A stratified thermal store has been shown by prior literature to maximize temperature of the hot water drawn from the tank and simultaneously minimize collector inlet temperature required for effective heat transfer from the ...

As shown in Fig. 1, the new water tank is divided into 4 connected small tanks by using high/low partitions, and the upper and lower flow plates are added to the two middle tanks. The equalizing plates have uniformly distributed small holes with a diameter of 10 mm. The distribution of holes on the equalizing flow plate is arranged in a 9 columns &#215; 19 rows pattern.

Thermal mixing and stratification are explored numerically and experimentally in a cylindrical tank, which simulates a storage of water heated by a solar collector. The tank is 70 cm in height and 24 cm in diameter. The inlet and outlet are vertical and located off the centerline of the tank. The study is conducted in a transient mode, namely, the tank is filled with hot water, and as the hot ...

In this paper, the thermal behavior of a vertical domestic hot water storage tank during the dynamic mode was studied. A 3D computational fluid dynamic (CFD) model was performed using the commercial software package Fluent v6.3. The proposed model was validated with experimental data obtained from the literature. The results of the simulation ...

The single-tank latent heat thermal energy storage (LHTES) of solar energy mainly consists of two modules:

# Water tank energy storage experimental device

the first one is the phase change material (PCM) module heated by solar energy; the second is a module of heat transfer between melted PCM and the user's low-temperature water. This paper mainly focuses on the former one. To investigate the heat ...

Many researchers have presented their studies regarding thermal stratification in water storage tanks. Rodrigues et al. [7] had carried out a non-dimensional analysis to represent the transient natural convection model for domestic storage tank. They identified that heat losses through the walls are controlled by Rayleigh number, overall heat loss coefficient, and aspect ...

Stratified tank models are used to simulate thermal storage in applications such as residential or commercial hot-water storage tanks, chilled-water storage tanks, and solar thermal systems. The energy efficiency of these applications relates to the system components and the level of stratification maintained during various flow events in the tank. One ...

(2013) compared two water inlet devices in a hot water storage tank during a thermal charge process: a sintered bronze conical diffuser (SBCD) and a conventional ...

The accuracy of the out-temperature of the boiler and thermostat water tank are both  $\pm 0.1$  °C, and that of the ultrasonic heat meter is  $\pm 3\%$ . When the temperature of the outlet water of the LHTES device does not change more than 1 °C within 10 min or the heat storage time reaches 8 h, the charging stage is considered to be over.

In this paper, a vibration-based piezoelectric energy harvesting device is proposed, which is composed of a piezoelectric beam and a tank with water filling for forming a cantilever beam. The operating principle and structure of the system are proposed. Sloshing of water in the tank influences the mechanical response of the harvester.

Phase change material (PCM) water tanks have a major influence on the efficiency improvement of solar energy systems. This article discusses the effects of PCM under various inlets in a tank based on related research. So as to research the performance of the water storage tank, this paper built a set of water tank experimental systems using sodium acetate ...

coupled with a dry cooler, has been presented at a representative lab-scale (100 kW air cooler and 13 m<sup>3</sup> storage tank). Preliminary characterization of the dual-media thermocline storage has confirmed relevant and correct behaviors.

TES efficiency is one the most common ones (which is the ratio of thermal energy recovered from the storage at discharge temperature to the total thermal energy input at charging temperature) (Dahash et al., 2019a): (3)  $TES = \frac{Q_{recovered}}{Q_{input}}$  Other important parameters include discharge efficiency (ratio of total recovered ...
